

# Installation Guide

1. Code has to be opened to the users personal IntelliJ from "Appendix I".
2. Implementation of Jfoenix.jar and postgresql.jar is crucial.  
In order to do it, open File-Project Structure- Libraries in IntelliJ than click on add button and choose them from the "Appendix F and Appendix G respectively" .
3. Then open DBSHelper class at location  
"SEP2\_Forum\_v1\src\clientServerConnection\server\mediator\DBSHelper".  
Change the "dbUser" and "dbPass" in line 22 and 23 to be equal with your personal pgAdmin4 username and password.
4. Create new database in IntelliJ and copy the database txt code, what has been placed inside "folders location" folder.  
To create Poetforumv2 schema run the database txt code with the next order:
  - create schema
  - set search\_path
  - create tables
  - create foreign keys
  - Insert test mypage and threadId
5. To start the server, open  
"SEP2\_Forum\_v1\src\clientServerConnection\server\SocketServer".
6. To start the program, open  
"SEP2\_Forum\_v1\src\clientServerConnection\client\RunThisApplication".
